I. INTRODUCTION

• General presentation of the discipline: place and role of the discipline in the formation of the specific competences of the professional / specialty training program

General Chemistry curriculum for pharmacist qualification is a normative pedagogical document and a didactic tool for the efficient organization of the educational process. At the Nicolae Testemitanu State University of Medicine and Pharmacy the curriculum development is based on several normative regulatory documents: Framework Program for Pharmaceutical Higher Education in the Republic of Moldova, based on the University Charter of PI Nicolae Testemitanu SUMPh, Regulations for organization of studies in higher education based on the National Credit Studies System, no. 1/8 of 06.04.2017, Regulation for evaluation and academic performance in State University of Medicine and Pharmacy "Nicolae Testemitanu", no. 5/4 of 12.10.2016, coordinated with the curriculum of pharmaceutical disciplines (Analytical Chemistry, Organic Chemistry, Physical chemistry, Pharmaceutical chemistry).

Chemistry is a branch of physical science that studies the composition, structure, properties and change of matter. Chemistry is typically divided into several major sub-disciplines. One of them is General Chemistry. General Chemistry is chiefly concerned with atoms and molecules and their interactions and transformations, with gases, liquids, solids, soluble and insoluble mixtures. Inorganic Chemistry is the study of the properties and reactions of inorganic compounds. Chemistry plays a central role in science and is often intertwined with other branches of science like physics, biology, geology etc. Chemistry plays an important role in meeting human needs for health care products as well as other materials aimed at improving the quality of life. Many lifesaving drugs have been isolated from plant and animal sources or prepared by synthetic methods. With a better understanding of chemical principles, it has now become possible to design and synthesize new materials having specific properties. General Chemistry curriculum is for Pharmacy students, which will cover general and inorganic chemistry in relation to drug molecules, to provide the fundamental knowledge and overview of all core topics related to general, and inorganic chemistry.

Mission of the curriculum (aim) in professional training

As all drugs are chemicals, and pharmacy is mainly about the study of various aspects of drugs, including manufacture, storage, actions and toxicities, metabolisms and managements, chemistry plays a vital role in pharmacy education. Medicines or drugs that are taken for the treatment of various ailments are chemicals, either organic or inorganic. In order to have a proper understanding and knowledge of these drugs and their behavior, there is no other alternative but to learn chemistry. Everywhere, from discovery to development, from production and storage to administration, and from desired actions to

Redacția:	09
Data:	08.09.2021
Page. 3/15	

adverse effects of drugs, chemistry is involved directly. So, pharmacy students need a solid foundation in chemistry knowledge and it is needless to say that to become a good pharmacist the knowledge of the chemistry of drugs is essential.

Pharmacy students will learn a great deal of the information that has been gathered by scientists about chemistry. But chemistry is not just information. It is also a process for finding out more about matter and its changes. One of the aims of this course is to derive the main ideas of general and inorganic chemistry from chemical observations. Laboratory activities are the primary means that chemists use to learn more about matter. The activities in the general and inorganic chemistry laboratory require that students form and test hypotheses, measure and record data and observations, analyze those data, and draw conclusions based on those data and their knowledge of chemistry. These processes are the same as those used by professional pharmacists and all other scientists.

- Languages of the course: Romanian, Russian, English;
- Beneficiaries: students of the I year, faculty of Pharmacy.

II. MANAGEMENT OF THE DISCIPLINE

Code of discipline		F.01.O.002	
Name of the discipline		General Chemistry	
Person in charge of t	rson in charge of the discipline Chistruga Loghin, PhD, associate professor Melnic Silvia, PhD, associate professor		•
Year	I	Semesters	I
Total number of hours, including:			180
Lectures	45	Practical/laboratory hours	45
Seminars		Self-training	90

- "8" "

III. TRAINING AIMS WITHIN THE DISCIPLINE

At the end of the discipline study the student will be able to:

• at the level of knowledge and understanding:

- to understand the goals and objectives of general and inorganic chemistry, ways and methods of their accomplishments;
- to understand the main role and importance of general and inorganic chemistry methods in pharmacy, the scientist's practical activity in the pharmaceutical field;
- to know the main chapters, notions and methods of general and inorganic chemistry;
- to know connection properties between inorganic compounds and the position of elements in the periodic system;
- to calculate the energetic parameters for chemical processes;
- to know the bases of inorganic theory compounds structure and theory of chemical binding;
- to know main properties of chemical elements and their compounds;
- to know main types of inorganic compounds and their contemporary nomenclature (including complex compounds).

• at the application level:

- to work independently with the literature in the field of general and inorganic chemistry.
- to apply the principles processes and the technique of achieving the experimental work at the general and inorganic chemistry.
- to use at the laboratory class the main inorganic reagents, solvents and chemical dishes.
- to use properly the nomenclature of inorganic compounds.
- to calculate the main energetic parameters in order to study various chemical processes.
- to prepare solutions with the concentration of dissolved substances.
- to predict the direction of chemical reaction, applying factors that affect chemical equilibrium

• at the integration level:

- to estimate the significance of general and inorganic chemistry at the level of integration through pharmacy branches (pharmacology, pharmaceutical chemistry, toxicological chemistry, technology of medical products, etc).
- to know the chemical actions of different medical inorganic compounds in the human body.
- to study the most important chemical elements as well as their compounds, that are most used in the pharmaceutical field.
- to know the presence of chemical elements, especially bio-elements in the constitution of living matters, the way that this connects to the protein components, to establish their functions and behaviors in bioinorganic chemistry, also to take and to use for human benefits from what nature offers to us.

IV. PROVISIONAL TERMS AND CONDITIONS

Redacția:	09
Data:	08.09.2021
Page. 5/15	

Combining theoretical and practical studies, the primary goal of general and inorganic chemistry is to give out a full training that improves the productive forces, acceleration of the technical progress in medicine, industry, pharmacy, etc. Chemistry is the science of matter, its properties, and changes. According to the Curriculum that is oriented to the actual pedagogical principles, the material is presented in two parts:

General chemistry deals with theoretical bases of chemistry and refers to the main notions of the physical chemistry necessary to study inorganic chemistry.

Inorganic chemistry deals with the studying of elements and their compounds. Both the elements with nonmetallic properties followed by the elements with semi –metallic properties and the elements with metallic properties are studied.

The study of general and inorganic chemistry requires some level of mathematics and physics. These disciplines are a part of the language of chemistry, and a lack of familiarity with that language can become a barrier to success in understanding chemistry. The course assumes previous knowledge of chemistry. It is designed to provide students whose background includes secondary school chemistry.

V. THEMES AND ESTIMATE ALLOCATION OF HOURS

Lectures, practical hours/laboratory hours/seminars and self-training

		Nun	nber of h	ours
No. d/o	ТНЕМЕ	Lecture s	Practic al hours	Self- training
1.	Atomic structure. The quantum mechanical model of the atom. Quantum numbers. Arrangements of electrons in atoms.	3	3	6
2.	Electron configurations. Lanthanide contraction. Periodicity. Periodic properties of the elements.	2	3	4
3.	Chemical bond. Covalent bond and its properties. Valence bond theory. Molecular orbital theory. Chemistry of coordination compounds. Werner's theory. Nomenclature and classification of coordination complexes. Isomers of coordination complexes. Notions of chelatoterapy.	4	3	8
4.	Energy change in chemical processes. Internal energy. Enthalpy. Hess's Low. Direction of chemical reactions. Entropy. Gibbs free energy.		3	4
5.	Chemical equilibrium. The law of mass action. Equilibrium constants Kc, Kp, Ka. Le Châtelier's Principle. Chemical kinetics. Reaction rates. Factors that affect reaction rates. Notion of pharmacokinetics.	4	3	8
6.	Types of redox reactions. Balancing redox reactions. Predicting the direction of redox reactions. Quiz nr.1.	3	3	6
7.	Solutions. Composition of solutions. Expressions of concentration. Equivalent and equivalent factor.	3	3	6

VI. REFERENCE OBJECTIVES OF CONTENT UNITS

Objectives	Content units		
Chapter 1. Atomic structure and chemical bond.			
 To understand the quantum mechanical model of the atom To know the periodic law and its application To know quantum numbers and to be able to write electron configurations of atoms To know the properties of elements and to understand their periodic repetition. To understand valence bond theory and molecular orbital theory To define coordination compounds and to know the theory of coordination compounds To be able to write correct chemical formulas of coordination compounds and to name them To apply knowledge about complex compounds to other disciplines 	Atomic structure. The quantum mechanical model of the atom. Quantum numbers. Arrangements of electrons in atoms. Electron configurations. Lanthanide contraction. Periodicity. Periodic properties of the elements. Chemical bond. Covalent bond and its properties. Valence bond theory. Molecular orbital theory. Chemistry of coordination compounds. Werner's theory. Nomenclature and classification. Isomers of coordination compounds. Notions of chelatoterapy.		
Chapter 2. Energy change in chemical processes.			
• to define the first and the second law of	Energy change in chamical processes		

- to define the first and the second law of thermodynamics, and relate them to human body as an open system
- to know the notions of internal energy, enthalpy, entropy, Gibbs free energy
- to be able to determine enthalpy of a chemical reaction
- to be able to determine the dependence of the rate on concentration and temperature
- to define the notion of activation energy and to be able to determine it for a given chemical reaction
- to know the notion of pharmacokinetics
- to define Le Châtelier's principle and to understand factors that affect chemical equilibrium
- to be able to do thermodynamic and thermo chemical calculations
- To be able to write and balance redox reactions

Energy change in chemical processes. Internal energy. Enthalpy. Hess's Low. Entropy. Gibbs free energy.

Direction of chemical reactions. Chemical equilibrium.

Equilibrium constants Kc, Kp, Ka.

Factors that affect chemical equilibrium. Le Châtelier's Principle.

Chemical kinetics. Molecularity and order of chemical reactions.

Reaction rates. Factors that affect reaction rates.

Van't Hoff equation. Arrhenius equation.

Activation energy.

Notion of pharmacokinetics.

Types of redox reactions. Balancing Redox Reactions.

Predicting the direction of redox reactions.

Chapter 3. Solutions and their properties

 Redacția:
 09

 Data:
 08.09.2021

Page. 8/15

Objectives	Content units		
 To define solutions To know various expressions of concentration and their relations To be able to prepare a solution with a given concentration To be able to convert one kind of concentration measure into another To know properties of electrolytes and non-electrolytes To define ionization constants of acids and bases and relate them to the strengths of acids and bases To defined degree and constant of dissociation and relate them to the strength of an electrolyte To predict the acidity of salt solutions and to explain hydrolysis reactions 	Solutions. Composition of solution Expressions of concentration. Equivalent and equivalent factor. Weak electrolytes. Degree of dissociation Ionization constant. Ostwald's dilution low. Strong electrolytes. Ionic activity. Free-ionactivity coefficient. Ionic strength. Arrhenius acid—base theory. Brønsted—Lowry acid—base theory. Strengths of acids and bases. Acid (base) ionisation constant (Ka, Kb). Ion product of water. pH scale. pH and pOF Hydrolysis.		
Chapter 4. s block elements			
 To define s block elements and their position in the periodic system To know the properties of s elements To know the biological role of sodium, potassium, magnesium and calcium To understand the toxicity mechanism of beryllium and radioactive Sr-90 To know about the application of some s element compounds (NaCl, Na₂SO₄·10H₂O, KCl, NaHCO₃, NaBr, KBr, NaI) in medicine and pharmacy 	Macro- and micro- biogenic elements in a human body. The <i>s</i> block elements. Group IA: the alkali metals. Group IIA: the alkaline-earth metals. Biological role and toxicity of alkali and alkaline earth metals. The sodium-potassium pump. Toxicity of beryllium and radioactive Sr-90. Medicinal compounds of sodium, potassium, magnesium and calcium.		
 Chapter 5. d block elements To define d block elements and their position in 	The <i>d</i> block elements.		

- To define d block elements and their position in the periodic system
- To know the properties of *d* elements in different oxidation states
- To know test reactions for the following ions: Cr^{2+} , Fe^{2+} , Fe^{3+} , Co^{2+} , Ni^{2+} , Cu^{2+} , Ag^+ , Hg^{2+} , Hg_2^{2+} , Mn^{2+}
- To know the biological role of chromium, manganese, iron, cobalt, nickel, copper, zinc, cadmium
- To conclude about application of *d* element compounds in medicine and pharmacy

Specific properties of *d* elements.

Properties of VIB, VIIB, VIIIB, IB and IIB group elements.

Medicinal compounds of iron, cobalt, silver, gold, manganese, zinc and mercury.

Biological role of biometals.

Toxicity of cadmium and mercury compounds.

Platinum group metals.

Antitumor activity of platinum compounds.

Objectives	Content units
 To understand the toxicity mechanism of cadmium, mercury, molybdenum To know about antitumor activity of platinum compounds To know how to reduce the disorder of metal balance in the biosphere 	
Chapter 6. p block elements	The valence to
 To define p block elements and their position in the periodic system To demonstrate the change of properties of p elements in groups and periods To know the properties of p elements from IIIA – VIIA groups To know biological importance of nitrogen, oxygen, phosphorous, carbon, halogens etc To conclude about application of p element 	The <i>p</i> elements. General characteristics of the p elements. Properties of IIIA – VIIA groups elements. Main types of compounds: oxides, hydroxides (bases). Variable oxidation states. Biological importance of <i>p</i> elements. Medicinal compounds of boron, aluminum, lead, germanium, nitrogen, antimony, bismuth, sulphur. Halogens and their compounds in medicine.
 compounds in medicine and pharmacy To understand the toxicity mechanism of arsenic and halogen compounds To apply accumulated knowledge at other disciplines 	Their toxicity. Toxicity of arsenic compounds. The Marsh test. Antitumor activity of germanium

VII. PROFESSIONAL (SPECIFIC (SC)) AND TRANSVERSAL (TC) COMPETENCES AND STUDY OUTCOMES

✓ Professional (specific) (SC) competences

• PC1. Students to acquire familiarization with the basic notions, concepts, theories, laws and models of chemistry.

compounds.

- PC2. Ability to use adequate chemical terminology.
- PC3. An in-depth understanding of general and inorganic chemistry. Ability to demonstrate knowledge of chemical elements and their compounds (structure, physical chemical properties, synthesis etc.). Skills at applying theoretical knowledge of general and inorganic for the practical pharmaceutical purposes.
- PC4. Identification, description and adequate use of specific notions to complete the image of general and inorganic chemistry as applied science.
- PC5. Increase students' interest in study and investigation of inorganic compounds and chemical processes. Stimulation of analytical and synthetic thinking. Numeracy and calculation skills. Ability to interpret data from laboratory experiments in terms of their significance.
- PC6. Understanding the value of cultivating work-discipline, based on motivation, fairness, perseverance and efficiency.

Redacția:	09
Data:	08.09.2021

Page. 10/15

✓ Transversal competences (TC)

- TC1. Interpersonal skills, relating to the ability to interact with other people and to engage in team-working.
- TC2. Formation of professional and civic attitudes, allowing students to be honest, non-conflicted, cooperative, available to help people, interested in community development; to know and apply ethical principles related to medical-pharmaceutical practice; ability to recognize and analyze problems and plans strategies for their solution.
- TC3. To have openness to lifelong learning; to become aware of the need for individual study as a basis for personal autonomy and professional development.
- TC4. Ability to participate effectively in transdisciplinary teams working on research related to general and inorganic chemistry.

✓ Study outcomes

- To have adequate theoretical and practical knowledge of general and inorganic chemistry
- To know the principles of the electronic structures of inorganic compounds and theories of chemical bonding
- To know the main properties of chemical elements and their compounds
- To understand periodic repetition of elements physical and chemical properties
- To be able to do thermodynamic and kinetic calculations
- To be experienced in the safe handling of chemical materials as well in the handling of different chemical glassware and laboratory equipment
- To know biological importance as well as toxicity of inorganic medicinal compounds
- To be competent in the solving some chemical problems regarding to a given inorganic drug compounds

Note. Study outcomes (are deduced from the professional competencies and formative valences of the informational content of the discipline).

VIII. STUDENT'S SELF-TRAINING

No.	Expected product	Implementation strategies	Assessment criteria	Implementation terms
1.	Working with information sources	Careful reading of the assigned material before of each theoretical and practical lesson. Read the text-book in order to participate in class discussion, better follow the lecture, and ask meaningful questions. Reflect on the content as you read and take notes. Study worked out examples, which provide further illustration the ideas explained in text. Answer the questions. Prepare some instructions, notes as well as questions prior to arriving in the lab or in the class. Make acquaintance with supplementary bibliography units from the field of the studied discipline. Summarize and take notes in your own words to help you understand and retain information. Don't rely on highlighting as your main method of note-taking	Ability to extract the essentials, ability to survey the topics and concepts being studied; ability to review and reflect on the concepts that studied.	Throughout the semester
2.	Working problems	Solve the assigned problems. Working on problems in the book and other sources is an ideal way to prepare for chemistry disciplines.	Ability to work problems independently and correctly (not memorization). Achieving final answers that are completely correct is important.	Throughout the semester
3.	Working scientific essay	Select the topic and analyze it. The essay purpose should be unambiguously defined. Prepare a detailed outline of the essay and basic bibliography. Write definitions for each of the key terms. Start on the reading	The primary function of an assessment essay is to document what a student has learned. The higher quality student's essay the greater the	Throughout the semester

Page. 12/15

list, tacking the more general textbooks first and moving on the more specialized books, review articles etc. Take notes when reading. Working of the essay. Once the essay is finished it should be submitted to the lecturer.

progress the student will make in the session. Assessment student understanding; judgment about student achievement certain relevant points in the learning process of study.

IX. METHODOLOGICAL SUGGESTIONS FOR TEACHING-LEARNING-ASSESSMENT

• Teaching and learning methods used

The discipline General Chemistry is taught in a classical manner, which includes theoretical lectures and practical lessons. During the lecture the information of the course is presented. At practical classes students study the most necessary and significant laws of chemistry: Chemical thermodynamics, Chemical equilibrium, Chemical kinetics, Solution and their properties, Complex compounds, The atomic structure and chemical bond. The second part deals with principles of descriptive inorganic chemistry. The most important chemical elements, as well as their compounds which are most used in the pharmaceutical practice are studied.

Three (3) quizzes and seminars are given throughout the semester. Quizzes and seminars test student knowledge of central concepts, ability to synthesize information. They are intended to test student understanding of the course material before the exam. According to fix schedule, the students six hour per week work with the teacher and 6 hours by themselves. Main practical oriented skills and abilities are retained only due to student's hard individual work while doing tasks in solving problems, exercises, etc.

• Applied teaching strategies / technologies (specific to the discipline)

It is necessary to point out some of the discipline's features, along with some suggestions about how to achieve the greatest advantage in General Chemistry. Here are some ways that may help students to study.

If you 'think around' the subject you can generate the answer or more easily understand the topic. *Brainstorming* is a group creativity technique by which efforts are made to find a conclusion for a specific problem by gathering a list of ideas spontaneously contributed by its members. In other words, brainstorming is a situation where a group of people meet to generate new ideas and solutions around a specific domain of interest by removing inhibitions. Students are able to think more freely and they suggest many spontaneous new ideas as possible. All the ideas are noted down and are not criticized and after brainstorming session the ideas are evaluated.

 Redacția:
 09

 Data:
 08.09.2021

Page. 13/15

Working on problems in the book and other sources is an ideal way to prepare for chemistry disciplines. *Problem solving* requires application of a previously learned theory by the students. This requires analytical capacity and a capacity to analyze a problem and to solve it. Problem solving also plays an important role in developing some important skills like observing the problem, questioning, hypothesizing, investigating; analyzing and interpreting data, communicating results.

From the pedagogical point of view one of most pure methods of education is the passive listening of a course, even in case of its careful structuring and illustration. Carrying out of practical lesson as well as laboratory experiments is more effective, than the simple reading about task execution, and even more effective when teaching somebody else. The science learning goals of *laboratory experiences* include enhancing mastery of science subject matter, developing scientific reasoning abilities, developing practical skills, increasing understanding of the nature of science, cultivating interest in science and science learning, and improving teamwork abilities. The research suggests that laboratory experiences will be more likely to achieve these goals if they are designed with clear learning outcomes in mind, are thoughtfully sequenced into the flow of classroom science instruction, integrate learning of science content and process, and incorporate ongoing student reflection and discussion.

• *Methods of assessment* (including the method of final mark calculation)

Current: front and / or individual control via

- 1. applying the tests,
- 2. solving problems / exercises,
- 3. analysis of practical problems,
- 4. quizzes.

Final: exam

The final mark is calculated by the computer testing mark (exam) (50%) and the average mark for the semester (50%).

The exam is at the end of the I semester and it comprises all material on General and Inorganic Chemistry. The exam is a computer-based testing.

Exam is designed to reward understanding of the material and the ability to work problems independently and correctly (not memorization).

The average mark for the semester is based on total points earned for quizzes and student self-training.

Only a student whose average mark is 5.0 or better on the semester is allowed for the midterm or final exams. Attendance at all lectures is mandatory if students wish to be allowed to the exams.

The questions for exams are always approved by the head of department and are given to the students one month before exams.

 Redacția:
 09

 Data:
 08.09.2021

Page. 14/15

Method of mark rounding at different assessment stages

Intermediate marks scale (annual average, marks from the examination stages) 1,00-3,00	National Assessment System 2	ECTS Equivalent
	4	
3,01-4,99	4	FX
5,00	5	
5,01-5,50	5,5	E
5,51-6,0	6	
6,01-6,50	6,5	D
6,51-7,00	7	
7,01-7,50	7,5	C
7,51-8,00	8	
8,01-8,50	8,5	В
8,51-8,00	9	
9,01-9,50	9,5	A
9,51-10,0	10	

The average mark for the semester and the mark of final examination (computer assisted) - are expressed in numbers according to the mark scale (according to the table), and the final mark obtained is expressed in number with two decimals, which is transferred to student's record-book.

Absence on examination without good reason is recorded as "absent" and is equivalent to 0 (zero). The student has the right to have two re-examinations.
